Meeting records  [Transcript](#)

Summary

Working group defined its strategic purpose and established collaborative documentation processes for organizational AI adoption.

Defining Working Group Purpose

Group mission centers on organizational success with agentic systems via strategic guidance rather than purely technical implementation. Members prioritized addressing the necessary mindset shift over superficial tool adoption.

Identifying Core Strategic Focus

Participants agreed to develop frameworks for high-value use cases and educational resources for enterprise stakeholders. Scope encompasses both specific language models and broader enterprise AI strategy.

Establishing Collaborative Output

Decision made to draft a foundational article explaining the required paradigm shift as the primary deliverable. Drafts and raw notes will be managed through the existing GitHub repository.

Rate this Summary: [Helpful](#) or [Not Helpful](#)

Decisions

ALIGNED

- **GitHub issue tracker as storage location** The team agreed to utilize the GitHub issue tracker as the primary repository for storing meeting agendas and project artifacts.
- **Foundational paradigm shift as initial focus** The working group decided to prioritize the creation of a foundational narrative explaining the paradigm shift of agentic AI adoption before developing specific governance or adoption frameworks.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [Rebecca Veldon, Everett Zufelt] Review Pull Request: Evaluate the code changes submitted by Dylan in the project repository.
- ☐ [Ryan Lunka] Draft Narrative: Outline the paradigm shift and organizational impact of AI agents to facilitate group discussion.
- ☐ [Rebecca Veldon] Send Slack Invite: Invite Andrew Kumar to the team Slack channel.
- ☐ [Everett Zufelt, Andrew Kumar, Rebecca Veldon] Debrief Meetings: Synthesize feedback and discussions from recent sessions to determine strategic direction.

Details

- **Meeting Agenda and GitHub Processes:** Andrew Kumar, Everett Zufelt, and Rebecca Veldon discussed the meeting agenda and organization, confirming that the group will utilize the GitHub issue tracker for project management ([00:00:42](#)). Andrew Kumar identified a pull request from Dylan that required review. Everett Zufelt established that Andrew Kumar and Dylan have the authority to approve pull requests to avoid bottlenecks, with Rebecca Veldon potentially assisting if needed, rather than requiring Everett Zufelt to personally oversee every review ([00:01:48](#)).
- **Defining the Working Group Purpose:** Ryan Lunka expressed difficulty in identifying a tangible outcome, requesting clarification on the core business problem that necessitated the formation of this working group ([00:04:39](#)). Everett Zufelt defined the group's purpose as enabling companies to succeed with agentic systems, posing the central question: "If I could give your company every agent it needed, what else has to be true for your company to succeed?". The group aims to help brands navigate adoption, operation, and the necessary organizational changes rather than focusing solely on technical implementation ([00:07:08](#)).
- **The Organizational Mindset Shift:** Ryan Lunka argued that the primary barrier to AI adoption is a lack of fundamental understanding, noting that many organizations mistakenly attempt to treat AI software like static, traditional enterprise technology ([00:08:17](#)). Ryan Lunka and Everett Zufelt agreed that this

"people problem" and the need for a profound mindset shift must be addressed before organizations can effectively adopt AI ([00:09:38](#)). They criticized the "spray and pray" approach of providing tools like ChatGPT or Copilot to employees without providing strategic guidance, noting that this often results in ineffective usage and wasted investment ([00:11:52](#)) ([00:14:26](#)).

- **Identifying High-Value Use Cases:** Andrew Kumar proposed creating a framework to help companies identify their first high-value use case, which could prevent the "tapering down" of adoption that often occurs after the first month ([00:16:43](#)) ([00:31:43](#)). Ryan Lunka supported this, drawing a comparison to educational frameworks that move from guided "hand-holding" to independent application ([00:18:59](#)). Everett Zufelt added that while initial use cases are important, the group must also address long-term organizational capabilities, such as data hygiene and developing new operator mindsets ([00:17:44](#)).
- **Strategic Content Deliverables:** The group discussed specific artifacts to create, including a checklist for use-case selection and a resource articulating the fundamental "philosophy change" required by AI adoption ([00:21:45](#)). Jennifer Wright emphasized the importance of helping stakeholders reach an "aha moment" to secure organizational buy-in. Everett Zufelt suggested gathering 90-second videos of ambassadors sharing their experiences to help convey the impact of this paradigm shift to various professional personas ([00:23:59](#)).
- **Scope and Focus of Guidance:** Sezin Cagil inquired about the scope of the group, specifically asking whether discussions should be limited to specific LLM-based tools or broader enterprise AI tooling. The participants agreed that their scope must encompass both, as organizations are managing both individual LLM usage and broader tooling implementation ([00:25:21](#)). They acknowledged that while LLMs are a critical component, they are not a total organizational transformation solution on their own and require broader strategy ([00:28:16](#)).
- **Immediate Action Plan:** The group reached a consensus to draft a foundational article or blog post to explain the "why" and the necessary paradigm shift before moving into more complex adoption frameworks ([00:36:23](#)) ([00:38:23](#)). Ryan Lunka agreed to take the lead on the first draft, with Jennifer Wright offering to provide feedback. The team will use the deliverables folder in their GitHub repository to house raw thoughts and initial drafts to foster collaborative critique ([00:39:43](#)).
- **Finalizing Next Steps:** Andrew Kumar, Rebecca Veldon, and Everett Zufelt planned to meet to debrief on previous sessions and synthesize feedback into a

clearer direction for the group. Andrew Kumar provided links to reference materials, including an article regarding the "financial case for agentic AI" on Composable.com, to inspire the drafting process. Jennifer Wright noted that although they will be absent for the session in two weeks, they remain available for asynchronous collaboration ([00:40:39](#)).

You should review Gemini's notes to make sure they're accurate. [Get tips and learn how Gemini takes notes](#)

Agent Ecosystem Working Group 2: Agent Adoption and Operations - MACH Alliance - Transcript

00:00:00

Andrew Kumar: and we we did our kickoff and now we're doing uh sorry I'm still just coming down from that kickoff and kind of catching up. So

Everett Zufelt: I I was trying to figure out a way over the last few weeks to clone myself so that I could participate in it,

Andrew Kumar: it's

Sezin Cagil: Thank you.

Everett Zufelt: but that didn't

Andrew Kumar: okay.

Everett Zufelt: work.

Andrew Kumar: We need an Everett bot to represent

Ryan Lunka: You're clearly not deep enough in AI Twitter

Andrew Kumar: you.

Everett Zufelt: Yes,

Ryan Lunka: yet.

Everett Zufelt: trust trust me. Jen does not want there to be an Everett bot. She's good. One of me

Andrew Kumar: Um, all right. So, I'm just catching up on this. I think we had an agenda uh for today, but I cannot find it. I'm Rebecca. Did we line up an agenda for today? Sorry if I'm putting you on the

Rebecca Veldon: I did not get sent anything and then it was a bank holiday for me I'm afraid.

00:00:42

Andrew Kumar: spot.

Everett Zufelt: I think the goal for this week was to,

Rebecca Veldon: So I don't know.

Everett Zufelt: you know, you kind of kicked things off a couple weeks ago and then just gather perspectives on where we want to take this. Like there's a million directions we could go. And I think I think Andrew the goal for today was hey what given there's a million directions we could go what direction do we want to go? Or do we want to put our time and energy over the next few months in supporting brands with these big questions about adoption and operations?

Andrew Kumar: I think that is a fantastic topic. Uh I'm going to pull up the GitHub as well because I feel like we have a place to start storing these things, right? Let's get one moment

Everett Zufelt: Yeah,

Andrew Kumar: here.

Everett Zufelt: I think we were going to just use like the GitHub's issue tracker. Yeah.

Andrew Kumar: Oh,

Rebecca Veldon: Yep.

Andrew Kumar: fantastic. Oh, and we have a PR that's ready for you for your review, Everett.

00:01:48

Everett Zufelt: Oh, exciting.

Andrew Kumar: Can if I share my screen, does that work?

Ryan Lunka: works for me.

Rebecca Veldon: Yep, that's perfect.

Andrew Kumar: Okay. Okay. Okay. And then I'll zoom it in here a bit. So, we do have a PR it looks like from Dylan. Oh, so Oh, quite a bit of changes. Okay, that might be take a bit of a review then. Um, ever what do we I know last time you reviewed and approved my PR, I was pretty minor, but like do we have a an approval process or or do you have a preference on who can support these types of reviews?

Everett Zufelt: Yeah, I think probably it's I think you and Dylan should have the ability to do that. So, I think Rebecca and I can take that away as an action.

Andrew Kumar: All right,

Everett Zufelt: I just I don't think I don't I certainly don't think I should be a bottleneck on these things. So,

Andrew Kumar: perfect.

Everett Zufelt: But then I just think more broadly for today it's probably just a good idea

to just get folks sharing their their vision and their thoughts around um where we can take this where we can take our time and energy over the next few months.

00:03:12

Andrew Kumar: All right, fantastic. Should we do a bit of a a round table and I'll I'll capture it. Make sure I'm in the right link here. All right, here's your artifacts. Do I have the right screen sharing? No, I do not. Update this. Okay, let me try this again. Sorry. All right, this is the one we're looking at. Thank you very much. I think Jennifer for getting getting the right link here. Um I'm gonna Is everyone seeing my screen? Sorry. I I Yeah.

Jennifer Wright: Yeah, you're

Rebecca Veldon: Yeah,

Andrew Kumar: All right.

Rebecca Veldon: we can say

Andrew Kumar: All right. Fantastic.

Ryan Lunka: Yes.

Andrew Kumar: So So coming back to Everett and your your um kind of purpose for today's agenda. Um I think this would be a good place to start around purpose, example questions, proposed artifacts. Is everyone on the call taking a look at this? Ryan, I see you nodding. So,

00:04:39

Ryan Lunka: Yep.

Andrew Kumar: I'm going to pass to pass to you first for comment. What are your what are your thoughts, contributions, changes?

Ryan Lunka: Um, my so I'm still trying to get my head around kind of a tangible outcome here. Like I see there's like a bunch of proposed artifacts on there and they're all like I get what they all are individually, but I I guess the why is still a little unclear to me to some extent, which is why I feel a little stuck in the mud on actively being like, "Oh, let's just start here and do this thing first." Um, like if I were to go back, you know, pretend pretend we're a startup, like what is the like the driving core business problem that surfaced that the need to even start this working group? Not to imply that there isn't one, but just to like elevate it so we can kind of clarify that, clarify a direction around that.

Andrew Kumar: I have an opinion, but I'm going to hold it for the moment and and kind of open this up to the group.

00:06:03

Andrew Kumar: Uh, and maybe I'll put Everett, can I put you on the spot first, too?

Everett Zufelt: Sure. Um I mean if I wind it back, we when we think of the agent ecosystem program as a whole, what's our goal, right? With anything at the Mach Alliance, our goal is to enable end users to be able to get the most out of their technology investments uh within the ecosystem. Obviously, it's those those are investments that are being made around this kind of new confusing clunky area of agentic systems because, you know, there are no experts in this world quite yet. Um, we're all learning together. Uh and then when we thought about breaking down working groups, we thought, hey, we probably want a group that's more about like the we'll call it the hammers and nails, the architects,

Ryan Lunka: Yes.

Everett Zufelt: the the system uh the the the solution architects, the system integrators, the people who are trying to figure out how to build these things properly.

Ryan Lunka: Mhm.

Everett Zufelt: And and then how I describe this working group to people is uh the following.

00:07:08

Everett Zufelt: If we had a magic wand and could give your company every agent it needed, what else has to be true for your company to succeed with those agents? So, if I can give you the 10, 20, 100 agents that you need to be successful thesis, your your team won't use them. They'll use them the wrong way. They'll be terrified about their job security. They'll have to figure out how to do their job in a completely different way. You might even need to start to rethink functions and alignment and reporting because of structural changes that happen. It's like all of those, you know, if I could give you every agent you needed, what else needs to be true for you to be successful and grow using this technology? And that's that's really the why behind this working group. What do we need to do to get teams to learn these things? Adopt these things, get value from them, operate them over time. What happens when they go haywire? How do we catch that?

00:08:17

Everett Zufelt: What do you do operationally when something like that goes wrong?

Those are the types of questions that that everybody's asking, not just brands.

Everybody's asking these questions and and we're trying to help a figure out the questions, figure out some of the answers, and help educate people around it.

Andrew Kumar: Thanks ever. Does anyone else have any um comments on on purpose?

Ryan Lunka: So, yeah, sorry. I had a question in the room was asking me. Um, okay. I reacting to whatever it said. I go I go back to I I think I made this comment on the last this working group. I'm I'm sitting in both of them so I forget which one's which sometimes. Um one of the biggest barriers at both the individual and the organizational level to making any of this actually happen that is not a technology barrier is getting people across this chasm of fundamental understanding of AI based software versus traditional software. And like before I mean I I I think it's a little early to define like governance frameworks before like people are learning how to govern these things yet.

00:09:38

Ryan Lunka: Like we'll probably evolve into that over time. But none of that's going to happen if people are still trying to treat AI systems like traditional SAS or enterprise systems. And it's like a people problem. It's like a It's like a re-education problem that then pretty quickly will probably get into actually a personnel and organizational change problem more so than like a technology governance problem. Um, and these are fuzzy thoughts, so if I sound wishy-washy, trust your instinct on that. But I think that's directionally the first layer here to get get right and to like actually help move the needle for organizations. Like if you're just if you're just not if your entire organization is still set up around the same realities and constraints of the last 30 years, we don't have enough developers to deliver the technology we want being one of them. Um software is to be implemented and then it is relatively static once implemented being another one. Like these are like fundamental laws of nature that we just have all taken for granted for decades that are at least questioned now if not actually changed.

00:10:50

Ryan Lunka: And that's a mindset shift that has to be trained into people. Um, and and I think that's I think that's where we start is my

Jennifer Wright: So you're saying like hey the focus is get the buy in that this is different before trying to say what how

Ryan Lunka: opinion.

Jennifer Wright: to manage the difference.

Everett Zufelt: and and and even before necessarily how to adopt it, right? Like step, you know, step one, why do I why do I care and what's different? And then maybe because what I'm hearing because if I don't even understand that if I have if I haven't even got myself there adopting agents is like well I gave everybody chat GBT or co-pilot what else am I supposed to do?

Ryan Lunka: I I try to be cautious of binaries like this before this, but directionally, yes, that's what I'm saying. Um because what you'll end up having is you'll have a bunch of people that try to roll out AI technology like it's an ERP or like it's a CRM or like it's insert enterprise technology here and it's not the same thing and then it's going to fall on its face and people will be like well that didn't work because the

00:11:52

Everett Zufelt: or or they or or they just stay in the I hey everybody's got Gemini or co-pilot so I don't know

Ryan Lunka: the Right.

Everett Zufelt: why they're not twice as fast as they used to be or you know like I don't know why I did my part see how much

Ryan Lunka: Right.

Everett Zufelt: money I'm spending on on my Google Workspace now they should be double the

Ryan Lunka: Right.

Everett Zufelt: And yes, I've had customers say

Ryan Lunka: I mean, I just talked to a big um plumbing distributor who um I have somebody in my family that works there and she was like, "Oh, we're we're trying out Chat GBT in the enterprise." I was like, "Oh, tell me about that. Like, how's that going?" And she's like, "Well, they just gave everybody chatbt for a month and we're going to see how it goes." I tried to put in a a CAD diagram to see if it would like design my kitchen for me and it didn't do it. So, I don't know if this is any good. I'm like, "Ah, this is this is

this is the

00:12:47

Everett Zufelt: I I I would agree. I think this is like you know fundamentally I think if

Ryan Lunka: problem.

Everett Zufelt: you're not there's a buy in there's an understanding and buyin that has to happen to a concept and I would agree and that concept isn't uh I've got an old crappy CMS I want a new shiny one that's we are not it is not the same type of thing um if it was the same type of thing we wouldn't have this working group and I think that Maybe the the answer to your initial why question is this working group exists because adopting a gentic technology is very different from the last couple of decades of technology changes.

Ryan Lunka: Yeah. And so I think if we were able to lay out some amount of a path to at the individual and therefore organizational level re resetting people's mindsets around what this technology wave is. I think that will lead you to what does that mean questions like what does that mean for the organizational structure? Now if this is true and we understand that in our organization what does that mean for our org structure and if this is true what does that mean for how we manage this technology as we roll it out like I think it'll all snowball into ultimately what you have listed out there um in terms of like governance frameworks and and and thereabouts but I think without that foundational mindset shift enablement for lack of a good term for it um I think it's gonna be I think it's gonna be a

00:14:26

Ryan Lunka: struggle I think it's gonna just look like an enterprise framework that we've seen a thousand times and I don't know how actionable it'll be.

Sezin Cagil: And I guess in that case what we are saying is that we will look into before companies can adopt AI rather than after they make that decision to adopt

Ryan Lunka: Yeah, like I said, I that's probably trueish.

Sezin Cagil: AI.

Ryan Lunka: I my personal perspective on it is not to put barriers in front of adoption to say you have to learn this before you can do that. Um so I view it more as like an in parallel type of a thing learning what you're doing but I my sense is that nobody even

knows how to have that mindset change conversation. So like to provide some guidance on how to do that I think could be very

Sezin Cagil: Yeah,

Ryan Lunka: valuable.

Sezin Cagil: like how to start or whatever.

Ryan Lunka: Yeah.

Sezin Cagil: I think J considerations or something like that.

Everett Zufelt: Yeah, I like

Sezin Cagil: I think we just need to you know frame what we want to achieve with the limited time we have otherwise we will have these

00:15:22

Everett Zufelt: that.

Sezin Cagil: endless conversations where we are we constantly confuse each other because everyone will think

Ryan Lunka: I

Sezin Cagil: differently and we don't live in the same organization either so we can't put a framework around the things

Ryan Lunka: agree.

Everett Zufelt: It's it's

Sezin Cagil: that we are discussing

Everett Zufelt: also it's also why uh you the tech for those who aren't on that group the tech group or the architecture group um decided to start its journey on defining what an what is an agent

Sezin Cagil: Okay.

Everett Zufelt: and it sounds silly because shouldn't we all know we're very technical people but it we

Sezin Cagil: No, not at all.

Everett Zufelt: had to have two conversations in order to get on the same page about what the answer to that question is and so I agree with you like what there's I I like where I like where we're starting like some sort of I think Jen you posted considerations right like getting started considerations understanding the paradigm shift I think that's an important component of

Sezin Cagil: Hey,

Everett Zufelt: the work we're going to do and it's probably not like a single article a single artifact right it's probably a there are brands that you know I would aren't ready to

properly adopt So as part of before, during or whatever that adoption journey there, they we need some amount of our time and energy to go into this.

00:16:43

Everett Zufelt: How do you switch your paradigm? I I like that concept.

Ryan Lunka: How do you how do you AI pill an organization?

Everett Zufelt: Yeah.

Ryan Lunka: That might be a good blog

Andrew Kumar: That might be uh Ryan. Also, I I thought I something came to mind as you were talking about this too,

Ryan Lunka: post.

Andrew Kumar: this framework because like hey everyone here's claude go have at her and then like that's just a a broad like I don't know spray and pray type of approach. what where my mind went was you know maybe we start thinking about a framework for identifying that first high value use case. So like where to deploy AI first in your business and the type of considerations and questions you need to ask for that. Um yeah because because otherwise um I think everyone will have broad adoption in the first month and then watch that taper down month over month from that point on. Uh and and then someone eventually will say why do we spend all these tokens on this?

Everett Zufelt: I I like that.

00:17:44

Everett Zufelt: I I'd add to that, Andrew. Like I think there's maybe two sides to that coin.

Andrew Kumar: So

Everett Zufelt: I like the because what we don't want to do is bore people with frameworks and conversations and research and nobody ever does anything. I think the flip side to the where to start coin is what what capabilities do you need to invest in as a company, right? Like there's I could go build a agent real fast. There's lots of tools with it. But if the eventual goal might be that I have hundreds of these things helping me run and grow my business, what are the thing what are the capabilities I need to invest in today? And they're not like not fla flash in the pan capabilities like over the next 18 months 24 months what do I need to be investing in so that I can have a robust agent strategy now obviously that comes with conviction right if we're still in that mindset

paradigm I agree I agree I don't want to stage things can't go here until you've gone there but probably if I still haven't understood the transformative capability of this technology shift I likely don't have the conviction to start investing in these capabilities.

00:18:59

Everett Zufelt: So I think that at an eventual point where we help people understand the capabilities they need to start to mature as an organization whether that be data access and hygiene or just op a different type of operator mindset for their employees. I think that's uh important to the long-term maturation and growth of value.

Ryan Lunka: Well, the the identifying the first use case part of it important because even if it's handheld, it takes you out of philosophy and into like, oh, now I can see what you're talking about.

Everett Zufelt: Absolutely.

Ryan Lunka: um like I kind of hearken back to I don't remember the name of the framework but I remember my a lot of my undergrad um it's 20 years ago now so definitely don't remember it but a lot of the way it was structured was around this like three tier um like learning framework where like first you talk about the topic and like walk through it line by line of code with the class and then the next level was um here's like a guided assign assignment that helps you that is still kind of step by step almost paint by numbers but you do it on your own and then the third one is here's a problem that you have to solve that you can now fill in the gaps on and like that's how you like actually ingrained the concept into your brain is to like work up from being handheld to slowly understanding how to apply on your own I think

00:20:30

Everett Zufelt: Oh, yeah.

Ryan Lunka: that that first case study is how you do the handheld and I guess why everybody's this Ford deployed engineer thing is all of a sudden like the hottest term in the market because that that's what you're trying to accomplish, right? You're trying to push people in who understand how to do this right next to the people who don't so they can handhold them through that first use case.

Everett Zufelt: I think there's eventually and I think this is even further out work like maybe not even this year work for this working group there's probably eventually some

consideration to I I hey shift paradigms get some early use case wins think about where we're investing in capabilities. I think eventually there's how does how might your fundamental structure like what what roles don't exist in your organization today that might need to start to exist like what how might your structure need to change? What roles might need to start to come into converge or or start to exist that never existed before in order to truly capture all the value that that this technology enables.

00:21:45

Everett Zufelt: I don't I don't think we start there, but I think that's a place where at a certain point everything else hits a wall and your organizational structure starts to become the the limiting factor.

Ryan Lunka: I mean two if we want to circle back to like tangible outputs that we could create. Now, two that are kind of coming to mind for me emerging out of this conversation are one is like Andrew said a checklist or something akin to that of like how do you pick your first use case? Like what attributes of the business problem should you look for, the types of teams or people that are involved? like what what should you when you scan your entire organization, what should you look for to be like these are my three best candidates for our first agent use case? I think that's like an artifact that probably gets built into something more comprehensive later, but it's at least a starting point artifact that I think we could build right now. I think another one would be kind of laying out that philosophy change like okay, we all we all sort of know there's like this mindset shift, but like what does that mean?

00:22:58

Ryan Lunka: what what organizational assumptions that have just existed as law for forever have now fundamentally changed and kind of list those out. And again, probably something that gets built into a bigger framework later, but at least now can live on its own, could potentially be a blog post, could at least be like an educational foundational point, and then we build on it from there.

Everett Zufelt: I I like I like both those. I like that last one, right? Because something happened and and I think most people know the thing happened. I don't think most leaders in most companies know how to clock the implications. like they get something changed. Chachibby Gemini Claude, I get it. I'm hearing about it. I'm reading about it. I

don't really understand what it what does that really mean for me and my and my company. So, I I really like that. How do we explain what it mean? Like you all know this thing happened. How can we explain the implications and how you need to start thinking differently?

00:23:59

Everett Zufelt: I really like that angle.

Jennifer Wright: And I think it goes back to like last time we were talking about like how do you help people have that aha moment or the can't unsee it moment of this isn't you're not just like buying another system like you did last year. Um, and how you think about this like how how do we help people essentially

Everett Zufelt: Yeah.

Jennifer Wright: be bought in so that when we then are providing kind of like this guidance around well okay now that you understand that that's your foundation for how do you approach adoption how do you approach governance how do you approach x y and zed

Everett Zufelt: And when I think about nailing it, like I think how do you get, you know, now I have my marketing hat on.

Sezin Cagil: I

Everett Zufelt: I think how do we get you know eight to 10 like 90 second videos of people telling of people sharing their mo that moment right how do we get our ideally our ambassadors sharing their I I can't unexperience this moment and if we get it if we get like you know eightish of them then there's going going to be enough variance in it that that by and large we're going to cover the field on resonating with different different roles, personas,

00:25:21

Sezin Cagil: Sorry, I have a stupid question.

Everett Zufelt: etc.

Sezin Cagil: Are we done then focusing the discussion on the CH GPT cloud work work that you use as you know an NLM that you use as part of your day job

Ryan Lunka: It was a really good call.

Sezin Cagil: or are we talking about AI tooling that you can go purchase this and that

because there is a fundamental difference right when you buy a tooling you will follow the vendor and they will put together a framework to onboard you whereas if you as an individual

Everett Zufelt: Yeah.

Sezin Cagil: need to use an LLM, you need to have clever ways of approaching that as a new

Everett Zufelt: I think the answer is yes.

Sezin Cagil: tool.

Everett Zufelt: Like I mean I think I think the answer is we probably have to address both of those things because because companies have to address both of those things.

Sezin Cagil: Okay.

Everett Zufelt: There's the you know there's the I gave everybody co-pilot so why are we not why haven't we transformed yet question which is a real question people ask. Um and part of it's because you gave them co-pilot and didn't do anything other than tell them good luck hope you figure it out yourself.

00:26:31

Everett Zufelt: Um part of it is and and I think maybe not with copilot but with things like claude you can get a long way with just that tool and then obviously over time as this technology matures and organizations mature they're going to find out that even with a co-pilot a claude they're going to hit a wall where other things are also needed. So I think the answer to both

Sezin Cagil: Okay,

Ryan Lunka: I think there's an opportunity to not be the vendor voice.

Sezin Cagil: where are we starting?

Ryan Lunka: Right.

Sezin Cagil: Okay,

Ryan Lunka: Right. Because

Sezin Cagil: I mean we are not I'm not from a vendor, right?

Ryan Lunka: the

Sezin Cagil: But there are people from vendors here probably in the group. But it is not relevant.

Everett Zufelt: Yeah.

Sezin Cagil: We can use that knowledge to onboard people within their own organizations to the

Everett Zufelt: Yeah. I think I think we have to like I think we have to for transformation

we obviously people might

Sezin Cagil: tooling.

Everett Zufelt: be missing critical tools but I think fundamentally you got to meet people where they're at to help them with

00:27:18

Ryan Lunka: Oh

Everett Zufelt: transformation.

Sezin Cagil: Okay.

Everett Zufelt: Yeah.

Sezin Cagil: In that case we are saying the the what did we say lo start where to

Everett Zufelt: Yeah. Yeah.

Sezin Cagil: start for an LLM in an enterprise.

Everett Zufelt: Yeah. Yeah. And I'd even take it a step further back because like you might not hopefully everybody at least has

Sezin Cagil: Yeah.

Everett Zufelt: some tool available to them today. Not that's not universally true. Um but like I would think this I think I think to Brian's point the step before even how to start with the LLM is how to start thinking differently. There's

Sezin Cagil: But I guess it is within the context of LLM, right? We are saying things that are too open-ended.

Everett Zufelt: a

Sezin Cagil: Again, this can turn into a philosophical discussion for hours. We have only an hour per two weeks. So, let's keep try to keep it focused to be able to move forward.

Everett Zufelt: I'd throw out a I'll throw out a thesis and people can disagree with me.

00:28:16

Everett Zufelt: Um, LLMs are great. Uh so like tools like let's be more specific Gemini chat GBT claude co-pilot are great and cannot transform a company on their own like the even the best claude user you're still probably not hitting transformative capability people can feel free to tell me they think I'm too much I think it's an important component But on its own will not transform an organization.

Ryan Lunka: I think I at least agree that it's unclear that that it's possible that those

platforms on their own will

Everett Zufelt: Yeah, I think that's a I think that's the right and I think it's a component by for sure but maybe not the the

Ryan Lunka: um

Everett Zufelt: complete end state.

Ryan Lunka: yeah claude is the best example of where I see like there's this whole spectrum from like I'm in the claude

Everett Zufelt: Yeah.

Ryan Lunka: chat, you know, web browser experience all the way to claude, you know, claude SDK and there's like that whole spectrum of versions of using cloud in between there where like you can kind of see how that all actually evolves into a comprehensive technology set for an

00:29:26

Everett Zufelt: Yeah.

Ryan Lunka: organization. the chat just being one chapter of it. But um it's at least ambiguous if not if not if I'm

Everett Zufelt: Cool.

Ryan Lunka: not in total agreement with you that that's not going to be enough to transform the

Everett Zufelt: But I do think but I do think getting started is probably hey did do you have a do you have a

Ryan Lunka: organization.

Everett Zufelt: mind do you understand what changed? Do you know what it means for your company? Have you listened to your employees? Frankly most of us aren't right. Have you listened to what your employees are excited about? What they're afraid of? What they've been doing and what they've been doing quote unquote behind your back and not even sharing with you? Are you helping them to are you champ are you finding the champions that are going to help transform your business? I mean this I think I think a lot of that initial can be based around

Ryan Lunka: Oh, yeah.

Everett Zufelt: these you know LLM based tools like cloud chat GPT and Gemini.

00:30:27

Everett Zufelt: I think a lot of that stuff can be focused

Ryan Lunka: What did I just tell you?

Everett Zufelt: there.

Jennifer Wright: I know Ryan you had kind of floated the two like if we're thinking like from a tangible perspective one and I think it was originally Andrew's of kind of that checklist the you know how to decide on your your first um and then there's also the second piece of like uh getting that buy in for kind of that paradigm shift of you know these are the four things that are completely different that if you approach AI or agents in the same way that you approach any other piece of your tech stack uh it's not going to work. Um do we want to focus on those? Do we feel like we have like alignment there or do we want to keep talking about kind of uh the the thing that we're trying to uh have come from this in more of the early days?

Everett Zufelt: Andrew, what are your thoughts?

Andrew Kumar: Um, I don't I don't I don't have an opinion or position.

00:31:43

Andrew Kumar: I just think I keep I keep hearing say we have a limited amount of time. We got to get started on something. Um, and and maybe the first artifact is blog post just opening up the question, opening up the the thoughts. I I'm I'm on the the vendor side, so I have a swayed swayed opinion of like I there's there's a million things you can do with MCP and agents and tools. Um I think there's a few very high impact things that are repetitive in nature. So then it's like okay, that's the first use case I want to dedicate all my attention to. and it it took almost two two and a half months to arrive at that first use case. Um so maybe maybe that we have we gather some anecdotes of you know how long you should expect before you're identifying before you can actually identify um when this makes sense or here are some anecdotes of when those aha moments happened so that everyone goes coming back to the example from Ryan like you everyone has access to Claude and then after a month they kind of give up on it but it might be like in the month two or month three month four before the aha moment happens and the ROI happens.

00:33:07

Ryan Lunka: Do you um Andrew, do you view it as a separate deliverable or part of the how to find your first use case one to help organizations even understand how to plan the value outcome for an AI project, the the R and the ROI because because I say value outcome because it's not always like a tangible, oh, we made X dollars because we did this agent. Might be in some cases, but not always. Um because I think somebody said it already that is one of the big gaps that are out there is everybody's talking about how expensive it is and all this inference costs but like nobody's saying it relative to value that is derived of it probably because nobody's even thinking about it. They're just doing it and then yeah it's more expensive because you're doing it now. Um you know a million dollars in inference is irrelevant if it's giving you \$30 million in value. Um, I is is figuring out that value story part of defining your first use case or is that on its own like a whole other chapter of things to be

00:34:16

Andrew Kumar: I have an opinion,

Ryan Lunka: defined?

Andrew Kumar: but I saw Ever come off mute, so I'm going to pass it to him first.

Everett Zufelt: I I feel like when you said the way you said it, it feels like it's the same thing. But if I twist what you said, it's like what's the value? What's the like can this thing create value for my enterprise and why is it different than any other tech people tell me I have to buy? I think that is different when we're talking at the like organizational value level. I think that is different. I think if it's hey value story let's go find the R and the ROI like it feels like it's talking about use cases. So I think it to me it's about levels of abstraction right. I think it's important to know how to find um I think Raj uh from the the Bloomreach a couple of years ago. I really liked a talk he gave. He used the term consequential AI like not just how do we find use cases?

00:35:16

Everett Zufelt: How do we find consequential use cases? I think that is one type of value story that aligns to like how do you pick your how do you pick your first use cases. I think the other type of value story is that more paradigm shift. How to think about the

world differently. Why is this different from the things that came before? So, I I just think the word value story fits both, but I do think there's two different things that we can work on as a group.

Ryan Lunka: Yeah, I mean I'm whether this is two or three or maybe four artifacts we've been talking about, I'm if we want to like really force ourselves into like let's make sure we're producing something out of the gate here and maybe it's content that gets severely changed or thrown away down the road. I think blog post is even an aggressive word for it because that means you need to make it all marketing fluffy and ready for publication. Sure, we can do that, too. But just like articles in the GitHub repo that lay some of these things out that we can try to iterate on and use it use to activate discussion tangibly.

00:36:23

Ryan Lunka: I think that's a great place to start.

Jennifer Wright: Yeah. Because even if the only thing that comes from it is this group is aligned, then I think that that's still a very productive thing.

Ryan Lunka: I have faith that at least some amount of it will eventually be useful down the road as we get to like defining bigger frameworks and bigger concepts that we're just in my opinion probably not ready to just do out the gate.

Andrew Kumar: Yeah, I'm I'm I'm a favor I'm in favor of this. We're we're publicly explaining the why or publicly addressing the why before we dive into adoption frameworks. I think that's uh probably a good forcing function too whether we think about it as a yeah but maybe a blog post to start um and then we'll get feedback.

Everett Zufelt: Yeah. Um I share for anybody who's curious, I shared in the Slack channel the article um from composable.com and it's like a couple of years old now. Uh it was ghost written for Raj at Gloomer. uh but I think it does a really good job uh capturing that concept that he shared around con what is consequential AI and and does lay out a a a perspective on a value framework.

00:37:40

Everett Zufelt: Uh and I think I think it's still a good way to look at the situation. So for anybody who's curious, I've tossed the article in there and then I I I

Andrew Kumar: Where is Sorry.

Everett Zufelt: actually uh Rebecca,

Andrew Kumar: Where's the Slack channel? I don't know if I'm I'm in it myself.

Everett Zufelt: do you know if Andrew's in there?

Rebecca Veldon: He should be. I remember double checking.

Jennifer Wright: I see you listed in

Everett Zufelt: Yeah, you're in

Jennifer Wright: it.

Rebecca Veldon: Yep.

Andrew Kumar: Is it my uniform email address by any chance and not

Rebecca Veldon: No, it's Bloom

Everett Zufelt: there.

Andrew Kumar: Bloom?

Jennifer Wright: Let's Yep.

Rebecca Veldon: Reach.

Jennifer Wright: You invited Patricia.

Andrew Kumar: Okay.

Rebecca Veldon: Yep. Okay. I will resend you an invitation cuz I can do that on my

Everett Zufelt: There you go.

Andrew Kumar: Oh,

Rebecca Veldon: end.

Andrew Kumar: sorry. And please and thank you.

Sezin Cagil: and I can ping you and you're on

Andrew Kumar: Yes.

Everett Zufelt: There we go.

00:38:23

Sezin Cagil: the

Everett Zufelt: Um, and so there I think it's a good read. I like the idea of let's start with one thing and and I want to get to really concrete things. I like the starting with the why idea um for the same reason that I liked how the the more architecture team started with what is an agent. What we found in the end is um starting from what is as an agent actually turned into an umbrella for the five or six things we want to go do together. So maybe that was a one-time thing, but I think if we start with this whole concept of why uh and why and change and implications, I think we're going to find out that through creating that artifact together, we find the five or six other artifacts we want to go create within it. If that makes sense. Cool. who feels they could over the next two weeks take a

stab at a first

Sezin Cagil: Yep.

Everett Zufelt: draft of that narrative for us to like all give thoughts and feedback and reactions to

00:39:43

Ryan Lunka: Um, I feel comfortable doing it, I'd be happy to. I don't want to insist

Everett Zufelt: anybody want to pair in with that.

Ryan Lunka: that

Jennifer Wright: I'm happy I'm I'm happy to be involved in more of the feedback piece if you want to take the

Everett Zufelt: Yeah. Cool.

Jennifer Wright: lead on the first draft.

Everett Zufelt: And you should all have access to GitHub and there's like a deliverables folder in that repo. So if you want to just posh your initial thoughts in there raw out in the world for everybody to critique then uh I did that last week for the other for the other group. felt a little bit vulnerable,

Ryan Lunka: I got no attitude.

Everett Zufelt: but uh then we can all we can all go kick it around and give some feedback and and get it to a place where we can get it out there and and published. I do think it'll be a good springboard for helping us feel some clarity on what the next

Andrew Kumar: Cool.

Everett Zufelt: handful of things are we want to do.

00:40:39

Ryan Lunka: I'm putting an issue in right now so I don't lose track of it.

Andrew Kumar: That is fantastic. Thank you. I I I put a link in now that I put a link to another composable.com on there some financial for I guess for inspiration financial case for identic AI that may be able to be woven together. I have no bias on this one. I'm a part of this article that Lee wrote. So I have full bias on article but it's there for reference.

Everett Zufelt: And then and then I think the other thing maybe Andrew, Rebecca, I'll I'll try to find time for the three of us and Dylan to just kind of stick our heads together and

kind of debrief on kind of what we've heard and thought over the last couple of sessions. Um,

Rebecca Veldon: Yeah,

Everett Zufelt: so that we can come back to the group saying, "Hey, here's everything we heard and here's some here's some uh more clear direction based on what we're hearing from the group."

Rebecca Veldon: that sounds like a good plan.

Andrew Kumar: Awesome.

Everett Zufelt: Cool. Awesome.

Jennifer Wright: All

Andrew Kumar: Awesome. Thank you everyone.

Jennifer Wright: righty.

Andrew Kumar: I think that was a good a good a good pivot. Micro pivot, but a good pivot.

Ryan Lunka: Hopefully I didn't distract you.

Andrew Kumar: I think it was the appropriate thing to do, Ryan. So,

Ryan Lunka: All

Andrew Kumar: I appreciate it.

Jennifer Wright: Um I'm not able to join the session two weeks from now.

Ryan Lunka: right.

Jennifer Wright: I'm out. Um but I uh anything I think sync I'm happy to kind of take a look at and Ryan as you're working on that piece as well. Um but yeah, otherwise Andrew, good luck with the rest of the hackathon.

Everett Zufelt: Yeah.

Andrew Kumar: I appreciate that.

Everett Zufelt: Awesome.

Andrew Kumar: Thank you.

Jennifer Wright: All right,

Rebecca Veldon: Bro,

Jennifer Wright: everyone.

Everett Zufelt: Thanks everyone.

Rebecca Veldon: right.

Andrew Kumar: Thanks everyone.

Rebecca Veldon: Okay.

Sezin Cagil: Bye. Bye.

Andrew Kumar: Cheers. Press.
