Meeting records  Transcript

Summary

Working group members aligned on governance and strategic frameworks to mitigate shadow agent risks and costs.

Group Focus and Priorities

The group differentiated its mission from architectural tasks, prioritizing organizational agent adoption. Members identified governance frameworks and strategic alignment as critical workstreams for managing agent

proliferation.

Addressing Financial and Governance

Participants discussed the urgent need to control shadow agent systems and justify AI expenditures to financial leadership. Establishing clear capital allocation strategies emerged as a primary requirement.

Workstream Consensus and Organization

The group reached a decision to prioritize Governance and Strategy workstreams, deferring complex developer productivity metrics. Members will self-organize into these tracks to build actionable frameworks.

Decisions

Aligned

- **Developer productivity metrics work deferred** The working group decided to defer work on developer productivity metrics due to the difficulty of reaching consensus and the desire to prioritize financial capital allocation conversations.
- **Strategic focus areas for working group established** The group established two primary work streams: AI system governance and taxonomy, and a strategic framework for transitioning from agentic experimentation to consequential business value.
- **Workstream self-organization process adopted** The group agreed to self-organize into these two specific workstreams and present detailed sub-bullets at the next meeting to guide progress.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [Everett Zufelt] Invite Tim: Contact Tim regarding his potential contribution to the governance and standards efforts within the group.
- ☐ [Andrew Kumar, Jessica Dvoretz] Connect professionally: Discuss synergies between Bloomreach and ECUM post-call.
- ☐ [The group] Draft strategy framework: Create an AI capital allocation and governance model to guide organizational planning and experimentation.
- ☐ [Everett Zufelt, Rebecca Veldon] Summarize Topics: Draft a summary of the identified working group topics and post the summary to the Slack channel.
- ☐ [The group] Develop Sub Bullets: Select a topic area to focus on and add 3 to 5 sub bullets to the project plan before the next meeting.
- ☐ [Rebecca Veldon] Propose Agenda Item: Advocate for the inclusion of the working group agenda items during the upcoming MockX meeting.
- ☐ [Rebecca Veldon] Reschedule Meeting: Update the recurring meeting calendar invite to 10:00 AM.

Details

- **Initial Introductions and Article Discussion:** The meeting commenced with informal discussion regarding a shared article on content supply chains and agentic lessons, which is part of a three-part series ([00:01:01](#)). Participants also briefly discussed their personal workspace setups, including standing desks and walking pads ([00:04:23](#)).
- **Introduction of Jessica Dvoretz and ECUM:** Jessica Dvoretz introduced themselves and their organization, ECUM, a new member of the MACH Alliance. They described their role as a retail data layer that sits between retailers, data stacks, and Large Language Models (LLMs) to ensure queries are accurate, consistent, and token-efficient ([00:06:18](#)). Jessica Dvoretz noted recent testing with Microsoft where they processed 187 complex queries for \$10 in tokens, demonstrating financial viability and efficiency through the use of ontologies and knowledge graphs ([00:07:32](#)).

- Group Introductions:** Andrew Kumar, Rebecca Veldon, Jennifer Wright, and Nick Miller provided their backgrounds. Andrew Kumar, based in Austin, noted their experience at Contentful, Uniform, and currently Bloomreach, where they are working on Lumi Connect ([00:09:51](#)). Rebecca Veldon described their role as the Data and Systems Manager for the MACH Alliance, and Jennifer Wright shared their role at Orium, focusing on professional services and change management for agentic adoption ([00:11:34](#)). Nick Miller, CEO of Pollucid Network, introduced themselves as a new member focused on cloud marketplaces ([00:12:30](#)).
- Review of Working Group Purpose:** Everett Zufelt clarified the purpose of this working group, distinguishing it from the Enterprise Agent Architecture working group. While the architecture group is focused on how to build agents and prepare for a hackathon at the MACH X event in Amsterdam, this group focuses on the broader impact of agent adoption: identifying what a company must change to be successful with agents if building them is assumed to be the "easy part" ([00:13:23](#)) ([00:16:23](#)). The group noted that they had previously published a series of articles discussing why agents have become relevant and what has changed in the landscape ([00:15:25](#)).
- Proposal for Governance Workstreams:** Ryan Lunka, the Head of AI for Aries, joined the discussion and proposed focusing on governance. Ryan Lunka is currently undertaking a project to catalog AI systems within an organization, including small cloud skills and autonomous agents, to track ownership, executive sponsorship, and contingency plans ([00:19:06](#)). They noted this project aligns with potential working group deliverables, such as an agent governance framework, production readiness checklists, and operations playbooks ([00:20:25](#)).
- Discussion on Shadow Agents and Governance Scope:** The group discussed the risks of unmanaged, ad-hoc agent experimentation within companies. Jessica Dvoretz highlighted concerns regarding information control and access, particularly with public companies where employees might have unfettered access to LLMs connected to sensitive data ([00:21:35](#)). Ryan Lunka and Everett Zufelt noted that many companies currently have employees experimenting with agents without any cohesive vision, oversight, or metrics, creating potential liabilities and "shadow" agent systems ([00:23:50](#)).
- Development of Strategy and Northstar Metrics:** Everett Zufelt and Ryan Lunka emphasized the need for a comprehensive strategy, or "Northstar," to guide AI investment. They argued that companies often distribute tools like Copilot or allow team experimentation without a plan, leading to a lack of consequential

business outcomes ([00:27:42](#)). Jennifer Wright and Jessica Dvoretz suggested that the group should address how to evolve from isolated, experimental agent usage into a holistic organizational strategy ([00:29:54](#)) ([00:31:43](#)).

- **Financial Perspective on AI Spending:** The group discussed the challenge of justifying AI costs to leadership. Ryan Lunka and Everett Zufelt explained that when CFOs see large, unexpected bills for services like Claude without clear value attribution, their primary instinct is to cut funding or stop usage entirely ([00:30:54](#)) ([00:32:34](#)). The group identified a need to frame AI investments for CFOs by discussing capital allocation and demonstrating where Capital Expenditure (CapEx) investments can save Operating Expenditure (OpEx) ([00:31:43](#)) ([00:33:18](#)).
- **Defining Core Workstreams:** The group reached a consensus to prioritize two main areas: Governance/Audits and Strategy/Northstar development. They planned to utilize resources such as the "consequential AI" article and an existing strategy canvas for agentic AI to frame these workstreams ([00:34:15](#)). Jessica Dvoretz and Ryan Lunka agreed that addressing the "burning money" issue and creating a pathway forward for leadership was a highly relevant and timely topic ([00:36:36](#)).
- **Evaluation of Developer Productivity Metrics:** Ryan Lunka raised the question of whether the group should specifically address developer productivity metrics in the context of AI agents. The group determined that while this is a significant and timely topic, it is also a "big hairy ball" of complexity that has historically been an unsolvable debate. Everett Zufelt suggested that the group could provide more value by focusing on high-level strategy and governance first, potentially tabling the developer-specific metrics for a future conversation or separate initiative ([00:41:36](#)) ([00:45:48](#)).
- **Next Steps and Self-Organization:** Everett Zufelt suggested that the group use the Slack channel to self-organize around the two identified workstreams (Governance and Strategy). Participants were asked to identify which stream they felt most aligned with by the next meeting, where they would then define three to five sub-bullets for the chosen projects ([00:47:44](#)).
- **Mach X and Scheduling Updates:** Rebecca Veldon noted they would be discussing the agenda for the MACH X event in Amsterdam, where the working group might have a slot to share their progress ([00:49:46](#)). Finally, the group confirmed that future meetings will be moved to 10:00 a.m. Eastern time to accommodate member preferences ([00:50:42](#)).

Agent Ecosystem Working Group 2: Agent Adoption and Operations - MACH Alliance - Transcript

00:01:01

Jennifer Wright: Hello.

Rebecca Veldon: Hello. How are you doing?

Jennifer Wright: Good, thanks. How are you?

Rebecca Veldon: I'm good, thank you. I'm just wrapping a couple of bits up before the call.

Jennifer Wright: No worries.

Rebecca Veldon: It's one of those, isn't it? Use every last minute.

Jennifer Wright: I think that like the two minutes I sometimes have between meetings are my most productive and then seven minutes goes by and I'm late.

Rebecca Veldon: I Yeah, feel that. most such. Just making sure that no one's like, "Ah, there we go." I knew as soon as I said it, there was going to be someone waiting to be admitted.

Jennifer Wright: Hello.

Rebecca Veldon: Hello. All right, we've got a couple of people in now.

Jennifer Wright: Wonderful.

Everett Zufelt: Hey everyone.

Jennifer Wright: Hey

Everett Zufelt: Uh, not to read right now though you say that sort of thing and then everybody clicks the link and read it. I'm just sharing an article in on the channel Slack channel. Uh, it's from I think it's maybe from somebody who was at X in Toronto.

00:02:46

Everett Zufelt: I don't know. I read it. Thought it was a good read just around content supply chain and uh agents and some lessons that IGN learned. So, just tossing it in there. Read it. Don't read it. Thought it was interesting.

Jennifer Wright: I missed the meeting we had a couple weeks ago, but uh was excited to see an article come out of it and it sounds like it's turned into a three-part series.

Everett Zufelt: Yes. And my awareness is I think I don't remember uh either either part two is this week and part three is next week or next week and the week after. But Lauren and the team have it all scheduled

Rebecca Veldon: There we go. There's Andrew. Just waiting on Dylan as

Jennifer Wright: Sounds

Rebecca Veldon: well.

Jennifer Wright: good. And I think Ryan said this week he's a no.

Andrew Kumar: Hello. Hello.

Jennifer Wright: Hey

Rebecca Veldon: Hello. Are you using a standing desk, Andrew?

Andrew Kumar: I am. Yes.

00:04:23

Andrew Kumar: Yeah.

Rebecca Veldon: Not.

Andrew Kumar: So,

Rebecca Veldon: So,

Andrew Kumar: sorry.

Rebecca Veldon: do you get a lot out of

Andrew Kumar: Say that again.

Rebecca Veldon: it?

Andrew Kumar: Sorry, Rebecca. I missed that.

Rebecca Veldon: Oh, do you get a lot of youth out of it?

Andrew Kumar: I never s I'm Yeah. full on sand.

Rebecca Veldon: No.

Andrew Kumar: I have a I have a walking pad somewhere, too. So, I used to I used to just like throw it under. Um,

Everett Zufelt: I've never tried the walking pad because I am I just know I'm not nearly coordinated enough for that.

Andrew Kumar: bye.

Everett Zufelt: But one of our team members uh Becky swears by it. Like absolutely swears by it under her desk. I also am always standing at my desk and mostly

Andrew Kumar: Yeah. Yeah. I have a I I also have a I have a weight vest just to my right there.

Everett Zufelt: patience.

Andrew Kumar: So, when I really get into it, I'll get the walking pad set up and I'll put a weight vest on and then I'll just be like, you just you passively burn a tremendous amount of calories.

00:05:15

Andrew Kumar: Um, and I started playing soccer again, so I feel like my my my body needs the uh the extra

Rebecca Veldon: What is it?

Andrew Kumar: push. So,

Jennifer Wright: Meanwhile,

Andrew Kumar: yeah.

Jennifer Wright: my standing desk stopped standing. So, it's a sitting desk now with a very heavy battery attached to it.

Everett Zufelt: Oh, awesome. Well, should we get things kicked off?

Rebecca Veldon: Sounds good.

Everett Zufelt: Um, I think our goal from last week was like, hey, like to come back and Jen, I know you weren't here, um, but to come back and say, hey, let's not try to boil the ocean. What are the next two or three things we want to work on together? Um, I'm not sure if folks have had a chance to think about it. I've given it a little bit of thought, but I'd like to try to stay quiet until other people have shared. They're just kind of curious, what do we want to work on next?

Andrew Kumar: Did we Did we get those blog posts out?

Everett Zufelt: Yeah, the first one was published last week and then the other two are scheduled for the next couple of

00:06:18

Andrew Kumar: Sorry. Okay. I apologize. I've been traveling. I have no idea what's going on in this working group.

Everett Zufelt: weeks.

Andrew Kumar: I'm so I feel like I'm quite a bit behind. Um,

Jessica Dvoretz: I'm also new to the group,

Andrew Kumar: okay.

Jessica Dvoretz: so I would love a

Everett Zufelt: Well,

Jessica Dvoretz: recap.

Everett Zufelt: then let's take ourselves back a couple steps. Um, do you want to do you want to give a quick

Jessica Dvoretz: Sure. Uh, hi, I'm Jessica D'voret.

Everett Zufelt: intro?

Jessica Dvoretz: Um I uh work at ECUM or um and we are a new member of the Mach Alliance as of I don't know two weeks ago. Um essentially we are a um we keep going

back and exactly how we describe ourselves but I think the current terminology is retail data layer. um and that we uh sit between retailers, data stacks um and LLMs and other agenic um uh applications um essentially making sure that data is reconciled and contextualized um so that uh queries are uh accurate, consistent and token efficient.

00:07:32

Jessica Dvoretz: Um, we just did some testing with Micro, we're publishing an agent with Microsoft right now. They did some testing. Um, they ran, I want to say, 187 queries and it used very complex ones because they're trying to break it. Um, and it used \$10 in tokens um against what we would have expected to be 132. Um so we think that you know we can help retailers um brands and retailers um really you know adopt um AI in a way that um is financially viable and doesn't lead to burning through annual token budgets in a

Everett Zufelt: and and in theory also,

Jessica Dvoretz: quarterly

Everett Zufelt: you know, if I'm if the if the amount if I'm sending tighter, better prompts because the data is cleaner and more accessible, I'm likely also getting better outcomes.

Jessica Dvoretz: Correct.

Everett Zufelt: Yeah.

Jessica Dvoretz: Um and also so um we use whatever your LLM is as an orchestrator and then they send the query directly to us. We have an ontology and a knowledge graph. So we know exactly what we have defined definitions, formulas, business rules.

00:08:44

Jessica Dvoretz: we get we very efficiently um find the information and then only pass back the fields um that actually answer the questions. So you know if a company has 150 stores and 250

Everett Zufelt: Nothing.

Jessica Dvoretz: SKs you know that's thousands of records to ask where did am I at risk of running out of stock and if it's um without like an EPM you'd pass back every field whereas with us you'd p uh pass back just the 45 let's say that require action this week. Um, so to your point, Everett, uh, we are better answers because you've kind of defined the rules and the agent isn't guessing. um and also much more efficient. And then since the idea of LLMs is that you get the answer and then you ask another question um you also don't have to kind of reserve the whole thing again.

Everett Zufelt: Thanks. Well, welcome to the group.

Jessica Dvoretz: Thank

Everett Zufelt: And so and and and so let's let's go back.

Jessica Dvoretz: you.

Andrew Kumar: Can can we do intros?

Everett Zufelt: What's the goal of this group?

00:09:51

Everett Zufelt: The man.

Andrew Kumar: Uh,

Everett Zufelt: Oh,

Andrew Kumar: sorry.

Everett Zufelt: sure. Yeah.

Andrew Kumar: Yeah.

Everett Zufelt: No. Fire away.

Andrew Kumar: And then do you also do you mind if I ask ask some questions in a few moments after the

Jessica Dvoretz: Of

Rebecca Veldon: Yes.

Andrew Kumar: intros?

Everett Zufelt: By the way,

Andrew Kumar: Um, okay.

Jessica Dvoretz: course.

Andrew Kumar: I'm Andrew by the way. Um, nice to meet everyone or I we've I've met most of you. Um, I am a Canadian originally from Vancouver and then Toronto. Now, I'm based in Austin, Texas. Um, I'm always going to consider myself a Canadian. This just happens to be south of the border. That's just the the framing. Um, and I work I used to work at Contentful. I used to work at Uniform. I currently work at Bloomreach. I have been attached to the Muk Alliance in some way, shape, or form for like a while. I've been attached to Contentful for like the last 10 years.

00:10:35

Andrew Kumar: So, moving to Bloomreach is really, really refreshing of like, hey, I'm out of the Contentful shadow. That's pretty interesting. Uh, I'm working on something called Lumi Connect. So, EKM EM caught my attention because uh what part of Bloomrate? Bloomer has a search catalog and it has a bunch of marketing automation tools and emails and SMSs as part of our product line and offering um all came together via acquisitions. So um a very common request is I need to fix all my product information and do merchandising operations on top of my search catalog and then

Jessica Dvoretz: would love to connect with you after we heard something similar from a bloop bloom client.

Andrew Kumar: yeah so that's perfect.

Jessica Dvoretz: So um

Andrew Kumar: Let's that that that seems like something that could be a nice nice segue.

Jessica Dvoretz: yes

Andrew Kumar: Um otherwise yeah I'm happy to be a part of this working group and um I I ever I think we have a bit of a bias because we are building and promoting uh um AI tools so adoption is pretty keen to us but also happy to support.

00:11:34

Andrew Kumar: That's me in a nutshell. Thank you.

Everett Zufelt: Who's next? Maybe Jenn or

Rebecca Veldon: I'm happy.

Everett Zufelt: Rebecca.

Rebecca Veldon: Oh,

Jennifer Wright: No, you go ahead,

Rebecca Veldon: hi, I'm Rebecca.

Jennifer Wright: Rebecca.

Rebecca Veldon: I work for the Mac Alliance directly as their data and systems manager and I'm just here to support

Everett Zufelt: Couldn't

Rebecca Veldon: uh with anything for the agent ecosystem. That's me.

Jennifer Wright: I can go next. Um, my name is Jen. I work at Orium. I I work closely with Ever, but we have two very different roles as part of this working group.

Everett Zufelt: Couldn't be more different.

Jennifer Wright: I couldn't be more different as people, but a very good partnership. Um, I lead our professional services delivery um, uh, ORC side of things uh, and have a very vested interest in in terms of kind of the change management transformation that's really going on as part of uh, Agentic adoption. Um, and been with this working group since we started in the beginning. Um, although missed last week and it was a big week.

00:12:30

Jennifer Wright: Uh, so anyways, really excited to meet you, Jessica.

Everett Zufelt: Who else do we have? Is that everybody or somebody else looking there?

Jennifer Wright: Um, I think Nick

Nick Miller: Yeah.

Everett Zufelt: Nick.

Nick Miller: Hey, Nick Miller. I'm uh first time first-time caller. Um uh I am the CEO of a company called Pollucid Network. We help enterprises adopt cloud marketplaces as part of their procurement and sourcing. And increasingly uh cloud marketplaces are how agents have come uh to bear or will come to bear. And so I'm exploring the mock alliances uh just to learn more about the ecosystem. We're a three-month old startup company. So, we're very new. Uh just yeah, just raised a4 million dollars and are getting started. But, uh yeah, thanks for having me. I'll just be listening in.

Rebecca Veldon: All right. And did you want me to just go over what we've been going over the last three sessions because we're now on session

Everett Zufelt: Yeah. I mean,

Rebecca Veldon: four?

00:13:23

Everett Zufelt: I think uh I think if we take two steps back,

Rebecca Veldon: Yep.

Everett Zufelt: this group seems to shift a little bit. Um why why does this working group exist? So there's a whole other working group that exists. Uh and I think Jess Abby from the team is has signed up to that one. Um uh and there's a whole other working group that's that's the enterprise agent architecture working group.

Jessica Dvoretz: Yes.

Everett Zufelt: People trying to figure out how do we build these things and and make them work and make them work well and make them work safely. And so how I've been describing this working group is if you had a magic if I had a magic wand and I could give company all of the agents it ever needed. What else would have to change in that company for them to be successful with agents? So, let's assume making an agent is the easy part, and it's not that easy, but it's it's easyish. If making the agents the easy part, what else has to be true for a company to truly benefit from the adoption and and operation of those agents?

00:14:26

Everett Zufelt: And that's why this group exists um is to try to help our enduser members learn how what to do about that problem. Um couple of thoughts is the enterprise agent architecture working group. They kind of started in the same spot we were. Well, what are we even going to do? What do we even want to do? Where where do we want to put our time in that? It feels like there's so many things we could do. How do we narrow it down? They started by answering a question which was what is an agent anyway? Now you'd think that you put a bunch of engineers in the room who have experience with agents and that would be a pretty easy answer but it took us two calls uh and we ended up with four and a half answers and we published those in an article uh and and on the mock alliance insight hub. So we actually couldn't come up with an answer to what is an agent. We we had multiple and I think for good reason because varying degrees of agency that we might put into one of these systems we built.

00:15:25

Everett Zufelt: This group started from a different perspective and that's those articles that you've heard being mentioned uh which is why agents like what why what changed in the world? What's happened that all of a sudden everybody can't stop talking about agents? And so actually Ryan in the working group put in the the lion share the effort and I thought he did a great job. Uh and we've turned that into a three article series. If you scroll up in the LinkedIn uh not the LinkedIn the the Slack channel you'll probably see some of the conversation around that. The first of those three articles has been published. The other two will get published over the next couple of weeks. But this group kind of started not from what is an agent but from what changed and why does it even matter to a company. I'll say the working group, thank you. Thank you, Jen. Um, I'll say the other working group also kind of to help answer the question, well, how are we even going to spend our time together?

00:16:23

Everett Zufelt: Picked a goal and their goal was there's a mock X event happening in Amsterdam at the end of September. They said we want to run a a how to build an agent hackathon. Yeah. At that event. And so everything they're prioritizing and working around is just how can the folks in that working group, you know, build out the materials, the questions, the code samples, the talk track, the slide, like all the like there's a real project they're working on together, which is let's get ready for this hackathon. I'll be so upset if I have to go to Amsterdam at the end of September to be part of that. But I'll take one for the team and I'll and I'll fly from Canada to Amsterdam. Uh, Jen,

Andrew Kumar: Oh,

Everett Zufelt: I don't know how we Jen I don't I don't know how we justify Jen that you need to be at the

Andrew Kumar: that's a rough rough challenge.

Everett Zufelt: hackathon, but we'll figure out something. Um, Jen can hack. So

00:17:20

Andrew Kumar: Oh, wait, wait, Everett. Every on that note,

Everett Zufelt: that

Andrew Kumar: I have a blog post coming out because we just did our Lumi Connect hackathon with 900 registrants and I have all the data of like who actually builds agents and 30 30% of the builders are like marketing

Everett Zufelt: awesome not developers. Yeah,

Andrew Kumar: specialists, CRM specialists,

Everett Zufelt: absolutely.

Andrew Kumar: like just they're non-developers. Yeah. So,

Everett Zufelt: Yeah.

Andrew Kumar: uh so there we go. Oh, we might have some data to justify Jennifer joining.

Everett Zufelt: Going to Amsterdam. Yay. So, that's where we are is I think this group needs to figure out what do what do we want to work on? And I know Ryan actually tossed into the chat this morning a few areas he's most interested in. Um, but I think that's kind of the we maybe start the conversation there is what what do we want to work on? What would we what do people want to help? There's a million things we could do.

00:18:10

Everett Zufelt: Where do people think they're going to get their energy over the next little

Rebecca Veldon: Also,

Everett Zufelt: while?

Rebecca Veldon: we mentioned Ryan and he just appears clearly.

Everett Zufelt: I manifested Ryan into into existence. Hey there,

Rebecca Veldon: Okay.

Everett Zufelt: Ryan.

Ryan Lunka: Am I God?

Everett Zufelt: So, I think Yeah. So I think that's the qu the open question is we had a couple new members uh Ryan so we just kind of gave a little bit you did some intros did a little bit background uh maybe you should introduce yourself to the group and then um just the open question is over the next few months you know if we had to narrow it down to a couple two or three things what would we like to work on together and it's hard right because there's a million but you know we kind of have to narrow in and say well what what are we going to work

Ryan Lunka: Well, nice to meet the new folks here. I'm Ryan Lunka. I am the head of AI for Aries.

00:19:06

Ryan Lunka: We are an SI that primarily um builds out composable architectures for retailers and distributors.

Everett Zufelt: And Ryan, you'd shared some thoughts around I saw on the Slack earlier today, you shared some thoughts around where you're most interested. Do you want to talk a little bit about

Ryan Lunka: Yeah, I mean um I'm undergoing a project that's a little bit a governance um project uh myself anyway and so it overlap with I don't know exactly how it one to one overlaps with the deliverables on the on the charter but it seemed to at least potentially overlaps with a few of them. So, I'd be interested in participating there just because it's kind of killing two birds with one stone. I think the whole my premise in proposing the articles that we haven't now started publishing was just to kind of uh set a baseline tone for why the rest of the deliverables will be important. Maybe that's helpful, maybe it's not. But um I think we just start playing whackable on these things and V1 and V2 probably suck, but eventually we iterate them to something that's pretty useful.

00:20:25

Everett Zufelt: And I'm just taking a look at the ones you suggested. Uh uh do you want to I'm seeing three, four, and five. I'm not looking at the charter. Do you recall which ones those were? Okay, let's you have it open.

Jennifer Wright: I have I have it up on my screen.

Everett Zufelt: Oh, lovely. Thank

Ryan Lunka: No,

Jennifer Wright: Agent governance framework.

Everett Zufelt: you.

Jennifer Wright: So that's guard rails around autonomy. Agent production readiness checklist. So whether something's ready for production deployment.

Everett Zufelt: Oh, like that.

Jennifer Wright: Uh and then agent operations playbook. So operating agent systems in a production environment. So ownership monitoring practices

Ryan Lunka: Yeah.

Everett Zufelt: What if

Ryan Lunka: So the project I'm going into here is to basically catalog the entire company's

Jennifer Wright: etc.

Everett Zufelt: people

Ryan Lunka: AI systems, be they something as small as a cloud skill that's shared among a team all the way up to potentially an agent running autonomously doing some kind of work and building a catalog structure for that and includes like who owns it, you know, what's the plan if something goes sideways, you know, who's the sponsor, the executive sponsor for it, stuff like just building that that database and then the government's cover around it.

00:21:35

Everett Zufelt: You mean you mean you don't want hundreds of these zooming around a business with nobody knowing nobody even knowing

Ryan Lunka: So, no,

Everett Zufelt: that they're

Ryan Lunka: no,

Everett Zufelt: there?

Ryan Lunka: I don't see like a little bit of a liability. So, I don't know exactly how that fits into the the specific deliverables there, but it seemed like it at least touched all three of

Jessica Dvoretz: It is that like governance of agents from the perspective of kind of who owns

Ryan Lunka: those.

Jessica Dvoretz: each agent or is it a governance in the term in the sense of who can access right because as we unlock LLMs you know I I come from the business side so I think a lot about what a savvy analyst might be able to ask if Claude is sitting on top of an ERP and what new risks that might create for a

Ryan Lunka: Mhm.

Jessica Dvoretz: company, especially a public company. Um, you know, in terms of information control and access and do we really need our back and governance and you

Ryan Lunka: Yeah.

00:22:29

Jessica Dvoretz: know that I I don't have a client there. I just personally find it fascinating.

Ryan Lunka: Um

Jessica Dvoretz: Like it's something I think about what what a 24 year old an ambitious 24y old with, you know, unfettered access might do.

Ryan Lunka: um yes in my particular case I don't know that the data access controls for an agent are the biggest problem to solve today but I agree like It's conceptually by building this not this database for lack of a better word of all of the agentic systems that are in place and who owns them and what are they supposed to be doing and what are they supposed to be touching. Like as you extend that out, you're actually creating a process for uh registering the agentic system with the company so to speak, which would include things like evaluating data access and then make the follow up to that would be having a process to ensure that that's actually being respected and trusted and etc etc. So I think my answer is yes sis just I don't

Jessica Dvoretz: So I guess what's interesting, so it seems like your client kind of is coming from a world where lots of people have just gone off and build their own agent and now they're trying to rein it all in. Is like is that maybe like a frame?

00:23:50

Jessica Dvoretz: I think there are probably like two approaches. You know, some companies are um encouraging experimentation and now finding themselves in that place. Other other companies are creating more strategies um and then trying to kind of

Ryan Lunka: Mhm.

Jessica Dvoretz: like push it top down like moving all BI out of Looker into Claude or um there might be something there that gets what you want and kind of

Ryan Lunka: Yeah. Yeah, I mean the most the most common thing I'm seeing so far is the use case where we blame everybody clawed. They're doing stuff and then somebody goes, "Wait a minute. What are we spending all this money on?" And I think there's some stuff happening over here. Should it be happening there? And who owns this thing over here? And like it just it's like great, everybody has Claude now and they're doing stuff, but nobody has any vision for it or perspective on it or

Everett Zufelt: Yeah, I 100% agree.

Ryan Lunka: anything.

Jennifer Wright: And two people are doing Yeah. And two people are doing the same thing but are really excited about their thing.

00:24:51

Jennifer Wright: But neither of those things is part of the bigger

Ryan Lunka: Mhm. Well, and

Everett Zufelt: and and and it's all good but um

Jennifer Wright: picture.

Ryan Lunka: then

Everett Zufelt: inconsequential like it's good it feels good employees are

Jessica Dvoretz: Yes.

Everett Zufelt: happy but uh you know I'm going to steal a line from Raj Data the the Bloomreach CEO it's not consequential to the business like we're spending half a million dollars a year on Claude and I can't point at any metric that changed.

Andrew Kumar: He he well I said we're also biased because we have an opinion that your business is unique. Your agents also should be unique so that they match the needs of your business. Claude is a very good generalist, right? It's a very very And I'm also biased, dude. I hit the f*** I hit the Claude limits twice yesterday and I'm like I'm done paying for this.

Jessica Dvoretz: It's down today.

Everett Zufelt: It was down this morning. It just awful.

Jessica Dvoretz: Have you gotten it back up yet?

00:25:52

Jessica Dvoretz: I I hadn't been able to get

Everett Zufelt: It was back. It was back up for me, but no, it was awful. I'm like, well,

Jessica Dvoretz: it.

Everett Zufelt: I guess I need to go make another coffee. I don't know what I'm going to do without this thing in front of me. Which is sad, but true. And I'm not ashamed.

Jennifer Wright: Is

Jessica Dvoretz: I literally confessed on Slack. I was like, "My claw is down. I'm feel kind of

Jennifer Wright: it

Everett Zufelt: But I So, Ryan, I'm I love I love where you want to get started.

Jessica Dvoretz: helpless.

Everett Zufelt: I'm actually also going to I've already sent a message. I'm going to see if I can loop in uh my buddy Tim, who's Orium's senior director of standards, compliance, governance, whatever. Because I know he's working on some of these things as well. And you know, hey, a few people working on it together. we're gonna do a better job and and go faster. So, I'm gonna see if I can uh encourage slashvolunteer Tim to uh jump in here and help move those ones

00:26:46

Ryan Lunka: Yeah,

Everett Zufelt: forward.

Ryan Lunka: I think the artifact could look something like if you were to create a database of AI systems within an organization or within a you know maybe it's just a team if it's a larger enterprise however your scope of governance is like what's that taxonomy at least as a starting point what should your taxonomy in terms of like what are your problems in your database that you should be tracking because then if you

have that sort of object model so to speak to find now you can start building process around how you're going to manage who is responsible for owning that database who's responsible for like what's the process to get something added to it is there approval required what are the other like the data access for instance types of dependencies you have to revolve for it and that feels like uh going back to my object-oriented from programming days. But if you define that thing first, like that feels like the the first

Everett Zufelt: I like

Jessica Dvoretz: I love the idea of addressing that under the umbrella of what you talked about Everett in terms

00:27:42

Everett Zufelt: that.

Ryan Lunka: step.

Jessica Dvoretz: of like how do you make investments in AI move the needle

Everett Zufelt: And and how do you Yeah, it's it's interesting, right? We're working we're working with a customer right now who I mean they're doing thing that they're doing things like Ryan like you know like Ryan described there's things happening they can even point at some very specific benefits right they can hey we did this experiment with Google we got this benefit we have given co-pilot to people we we we've started to ask teams to to kind of anecdotally report back you know where they're saving time and what they're using that time savings on like so they but They're also sitting there saying ad hoc there's no strategy, there's no plan, there's no destination, right? Like we don't know where we're going, we don't know why we're going there, we don't have a plan to get there, but we've given some tools to some people and we can point at some benefits, right? Like and that's probably my guess is that's where 98% of companies are sitting today.

00:28:52

Everett Zufelt: We've handed out some some tools. We had we've got a sense that there's a benefit, but we have no northstar strategy or plan or capability investment model or nothing. We got nothing to get us from where we are to where we want to go. And so I think that's a big piece to me. Like I I dropped in the Slack channel. Um I'm going to try to convince my buddy Kim to work with Ryan on on the more like it governance pieces. I kind of like that first artifact, right? which which I'll rephrase it to be what I want it to say instead of exactly what it does say is how do you build that plan? How do you how do you look at not only like the the macro plan, but then also there's a pretty big difference between I gave somebody co-pilot versus maybe we have like a organization skill repository for agents versus it has started to roll out these we'll call them like ambient or operational agents that execute in the background.

00:29:54

Everett Zufelt: Nobody really touches them. they just run right like those are all three very different ways of applying these technologies and I think like organizations need to have plans that talk about you know what's one person doing in co-pilot what are teams doing what's happening across teams what are some of those more IT managed systems and how are those things similar and how are they different and and how do we have from an adoption and operation standpoint how do we have to look at So,

Jessica Dvoretz: So, how do you go?

Everett Zufelt: that's an area I'd get excited about working

Jessica Dvoretz: So,

Everett Zufelt: on.

Jessica Dvoretz: how do you go from um aenic experimentation to a genenic

Everett Zufelt: Yeah.

Jessica Dvoretz: strategy?

Everett Zufelt: Yes.

Jennifer Wright: And I I think maybe that goes to one of the original artifacts of like the adoption framework or the like the maturity side of things that we were kind of talking about like what does it look like? Hey tools tools for everyone kind of is as is kind of that of like how do you actually evolve that to kind of that holistic strategy.

00:30:54

Ryan Lunka: I think this is the biggest problem in AI right now to be honest.

Jennifer Wright: It is.

Ryan Lunka: Um because partly because the media narrative around it is

Jennifer Wright: Yeah.

Ryan Lunka: b***** and that everybody's just like it's too expensive. It's going to crash all the A companies. See, look at how much Uber spent. And like okay guys, I get it. But the whole problem is it's a there's no capital allocation process, right? you know, the people who are responsible for capital allocation, the CFO and the CEO. Uh the CEO gets real jazzed about it because the board's giving them health and not doing AI stuff. And the CFO gets the quad bill at the end of the month and then goes, "Great,

Everett Zufelt: Yeah.

Ryan Lunka: we spent \$120,000 this month for what?" And then nobody can tell that

Everett Zufelt: On what? On

Jessica Dvoretz: And that's why you need to actually build a you need to build infra for token

Ryan Lunka: story.

Everett Zufelt: what?

Jessica Dvoretz: efficiency, right? So, experimentation and a real focus on end use tools.

00:31:43

Jessica Dvoretz: Ryan, I didn't you didn't you missed my introduction, but I work in AI infra. um we uh you need some sort of um semantic layer that's more than a dictionary. whether it be an ontology, a knowledge graph, you need some way to drive efficiency. And that requires an organized strategy because there's a real centralized investment. um and not just kind of letting everyone

Ryan Lunka: Mhm.

Jessica Dvoretz: go.

Ryan Lunka: Yeah, I agree.

Jessica Dvoretz: But it might be phases. It might be like what we might see is that what people do are um kind of empowering individuals to prove localized benefits seeing, you know, we hope they don't see too big a bill. Um but they see a bill and then they realize, whoa, like we got to get our senior leaders involved to develop a cohesive strategy. And we could kind of try to make the case that that's where the market is now.

Ryan Lunka: I I don't even know.

Everett Zufelt: Yeah.

Ryan Lunka: I think the problem is the market doesn't even know how to the market is not recognizing the problem.

00:32:34

Jessica Dvoretz: Thank

Ryan Lunka: Oh crap, we spent 120k on plot. What are we getting from it? My worry is that the market is going to Yeah,

Everett Zufelt: The CFO sees the CFO knows the problem.

Ryan Lunka: but my my worry is they're going to react to it the wrong way by just saying stop doing it or cut it way back because that's the only tool they have in their toolbox to do it. They don't they don't they don't have the vocabulary or the

Everett Zufelt: Yes. Can cancel. Can they have a cancel button?

Ryan Lunka: Yeah.

Everett Zufelt: That's what they've got.

Ryan Lunka: Right. Right.

Jessica Dvoretz: Of

Ryan Lunka: They they don't have the means to even like reframe the conversation.

Everett Zufelt: Yes.

Ryan Lunka: If you say the word autogy to a CFO, they're going to look at you like you're freaking nuts. Like they're like, "Oh, okay. That's expensive.

Everett Zufelt: Yes.

Ryan Lunka: What are you What are you talking

Jessica Dvoretz: course.

Everett Zufelt: That that there's a lot of syllables.

Ryan Lunka: about?" Yeah.

00:33:18

Everett Zufelt: If I'm paying a million dollars per syllable, I don't want one of those.

Ryan Lunka: But so finding a a framework to bridge that would be awesome.

Everett Zufelt: I I I agree because I agree and I think that's the strate like do we

Jessica Dvoretz: Yeah. I

Everett Zufelt: have do we know where we're going like assumption if we have a northstar and we know where we're going and

Jessica Dvoretz: mean,

Everett Zufelt: we've agreed as an executive team that it's a beneficial place like there's a financial benefit to getting there and if we have a strat and it supports our cor our corporate and commercial strategy then when I see my bill for \$150,000 a month I can at least say, "Okay, this is this goes under that strategy we built. There's a milestone coming up. I can like attribute these costs to this three month, six month, whatever milestone we picked as a committee, you know, I can I I now have something to allocate that cost to, but until then, I don't have a thing to allocate that cost to." So, like to Ryan's point, it's just burning money.

00:34:15

Everett Zufelt: If if I'm a CEO, a CFO, it's just burning money at that point in time.

Jessica Dvoretz: Yep.

Everett Zufelt: So I So anyway, I think those are two and and maybe we can just start with two because like they're both big and th those are two areas that I think probably

different folks in the they overlap and and and folks in this group are probably going to get a

Ryan Lunka: They they overlap them.

Everett Zufelt: bunch of energy out of out of working on. I shared two resources in our Slack channel. Jen, I'm not sure if you're in the channel uh because when I tagged you, you didn't show up, but um uh I shared two. One's just the article that from composable.com, uh, the Raj Bloomreach article about consequential AI. If you want to go peek at it, I think it was a good one. Um, and then the other one is a resource that Jen and I built last year at some point. Uh, which is a strategy canvas for Aentic AI. Just like here's a basically a a toolbox of strategy exercises uh that firms can use as they're trying to figure out the answers to some of these questions.

00:35:14

Everett Zufelt: And uh I think those are we can like those are two pieces that we can kind of look at you know cutting and pasting and mixing and matching um as we're working on some of this content.

Jessica Dvoretz: Right.

Jennifer Wright: Do we want to pick one thing that we're working on as part like some of that framing piece? Do we want to divide and conquer some of it? I I know uh kind of interest in different pieces.

Jessica Dvoretz: I think the really of the- moment conversation that we could really insert ourselves into is like you have experimentation, it's burning through tokens. Now what? like like it seems like on the on the kind of um operator side like the that that's all they know is like I mean when Walmart announced that it was limiting AI access um and their shares went down 2% everyone I know in retail started paying attention like it became like the conversation so I don't know if that means we want to go there or we don't want to go there but in my mind that is We have the opportunity to kind of insert ourselves

00:36:36

Ryan Lunka: I agree with that.

Jessica Dvoretz: in

Ryan Lunka: um the the sort of taxonomy for cataloging your AI systems is like a necessary tool, but that that doesn't generate any enthusiasm or excitement outside of the group in terms of like being part of the zeitgeist, right? It's just a yep, it's a governance thing. Cool. Everybody loves governance. the the cost the cost conversation is huge right now and I

Everett Zufelt: Yes.

Ryan Lunka: I think very misguided in most cases and like to have a really strong counternarrative that gives a a path forward that isn't panic or cut the thing off like I think that's there's a big opportunity there. I agree with Jessica.

Everett Zufelt: A and it's like a and it's a guy and and to me like there's some things where you see the benefit immediately. There's other things where the benefit is going to accrue over time, but not if you do a knee-jerk cut the funding. And so, but if you're the CFO and nobody's shown you that plan, Jen and I used to joke we had a CFO who who would show us a plan which was like the target and I I'd always I was always the jerk in the room that I said, "Where's the rest of the plan?" He's like,

00:37:45

Ryan Lunka: Oops.

Everett Zufelt: "It's right here. It's on the slide. Here's the number you have to hit." Like, that's not a plan. That's a desire. the plan is the next 10 slides. How do we get there?

Ryan Lunka: Ouch.

Everett Zufelt: And I think as the CFO though in these big organizations, that's what's missing. You've got a slide that says it's costing me this much money a month, but nobody's given you the other 10 slides to justify why you're spending the money. And that I think that right there is a big question we can we can try to help break down for people and very timely as well. You know, I was talking to a couple of folks this week

and like the question came up. If I could prove to you that developers could produce four times as much value for 20% additional cost in, you know, tokens. Like if it's developer salary times 1.2 because the 0.2 2 is the tokens. Wouldn't it be a no-brainer to spend the 02?

00:38:50

Everett Zufelt: Like if you know if your average developer is making whatever, call it \$100,000 a year for a nice round number. If you're spending \$25,000 or \$20,000 a year on tokens for a developer, but they shipped two or three or four times more value, wouldn't it be a no-brainer to spend that 20%. Like when you make it that simple, it is. But then when you add up all the 20% times all the developers, all of a sudden on one slide, it doesn't feel like it was a good idea anymore. So like I think those are some of the questions we can help just bring into the open and let

Jessica Dvoretz: Yeah.

Everett Zufelt: everybody everybody hey guys everybody's having this conversation some people have a better answer some people don't but everybody has like this question exists for everybody.

Jennifer Wright: It might be kind of interesting to also take it from the perspective of, you know, more of the finance side of things. The instinct is press the alarm red stop button. Uh, you know, what how to kind of think about it, but also from the other side of, hey, you're about to go asking for the money side of things.

00:39:46

Jennifer Wright: how to frame that case, that strategy of what you're trying to do. Um, it I there's kind of two very interesting perspectives to the money

Jessica Dvoretz: And if we're trying to be CFO friendly,

Jennifer Wright: debate.

Jessica Dvoretz: we could talk about capex investment to save opex, which is something that they typically

Jennifer Wright: Mhm. Um,

Jessica Dvoretz: Mike.

Jennifer Wright: do we have any um like more finance oriented folks that we can maybe lean on as part of the mock alliance? I don't know, Everett or Rebecca, if there's anyone that comes to

Everett Zufelt: Well, I think Terren,

Jennifer Wright: mind.

Everett Zufelt: who's the the the finance person for the Mach Alliance, is good, and I think Dylan, uh, when he's able to join in,

Rebecca Veldon: Yeah,

Everett Zufelt: will also be able to give some good thought on this as well.

Jennifer Wright: just like yeah like uh a piece to it. They don't have to be the like drivers of it but I think if we can just get some vetting from it from them might be helpful.

Rebecca Veldon: I feel like tearing in without

00:40:48

Jennifer Wright: Thank

Ryan Lunka: So, we kind of

Everett Zufelt: There was there was an sorry there was an idea that I think maybe Jen you said out loud or or Jen or Jessica I forget

Jennifer Wright: you.

Ryan Lunka: b

Everett Zufelt: which one like I I captured in my notes like this idea of how do you ask the CFO for money and I captured this idea of um you know hey why should why am I not just going to pull the plug on all to spend. Nobody can tell me. I think the other one was, you know, where where would an investment in capex save me opex when it comes to AI? But that was the third idea,

Jessica Dvoretz: Yes.

Everett Zufelt: right?

Jennifer Wright: Jessica gets all the credit for that

Jessica Dvoretz: With a

Jennifer Wright: one.

Jessica Dvoretz: obviously

Everett Zufelt: Well, we or Bloom Reach. There you go.

Jessica Dvoretz: together you need the customer information and the inventory

Andrew Kumar: Definitely.

Everett Zufelt: Awesome.

Jessica Dvoretz: information to really get the most Dana.

Andrew Kumar: Yeah.

Jessica Dvoretz: Yeah.

00:41:36

Jennifer Wright: data.

Ryan Lunka: Um, we kind of backed into a developer conversation by talking about uh token usage by software engineers, which is like a particularly pointed part of this conversation. It's not the whole part of the conversation. Um, how focused on that do we want to be right now?

Jennifer Wright: You're welcome.

Ryan Lunka: because on one hand it is a narrower topic and a very very timely topic to really insert into. It is also on the other hand a really difficult problem to solve because we've been arguing about developer productivity since long before cloud existed and this is just putting just reigniting a fire that's been around for decades that may be an unsolvable problem to be

Everett Zufelt: Yes.

Ryan Lunka: honest and I don't know how how far into that pool we want to weigh yet.

Everett Zufelt: Well, it's interesting, right? There's how do we the the questions have always existed around how do we measure productivity of a developer slash a

development team, the quality of what's being produced by that team and the security and safety. Like if we only considered three vectors, right?

00:42:49

Everett Zufelt: Level of value being produced, quality being produced and safety and security of what's being produced. Those are still the same three questions that I ask about aentic systems writing software which is how is it producing or how much is it producing how safe is what it's producing and how good is what it's

Ryan Lunka: Mhm.

Everett Zufelt: producing and there's a lot of nuance in all of those little bits and boba they're not different questions you know and if I can produce you know if a agent if a developer with an agent and let's again let's just throw out a number that says the the agent costs 20% of the salary of the developer So if that 1.2 times of cost can produce two times value at relatively similar quality and safety, why would anybody ever say no to that idea? Like why would you not want 80% for free? The problem is in measuring all those things.

Jennifer Wright: The other challenge is the other the the other side of the coin though is why do I need four if I've just multiplied my output type of thing.

00:43:55

Jennifer Wright: Right? So it's it's uh which I I think is the the fear part is

Everett Zufelt: There's that. Yes.

Jennifer Wright: the the other side of the coin and also the dollar signs in the eye is the other side of the coin.

Everett Zufelt: Yes. Yes. The the whenever any developer we do these little donut coffee chat thing. I'm not sure if anybody uses Slack. There's like little plugin. It randomly find you a person to have a coffee chat with every week. But we do that at ORM. And every

time I get matched up out to the developer, they're like, "Do you have any advice for me?" I'm like, it's been a long time since I've been a developer,

Ryan Lunka: That's the

Everett Zufelt: so you're probably asking the wrong person. My my advice I give every time,

Ryan Lunka: thing.

Everett Zufelt: learn how to be a product manager is always the advice I give when a developer asks like being a developer still valuable. I'm not I not be I don't want to be scary doom and gloom person.

00:44:37

Everett Zufelt: Be a great developer, but if you're asking what's more one more new thing to learn, I would learn how to be a great product manager because that multiclass product manager developer persona, I think they they're going to start to be able to print money in the next few years. So this bottleneck now that that I think we sometimes see in our organization is the bottleneck isn't how fast you can generate the features. It's actually how fast product management can define them which is starts to move us into like this whole new world of you know and I don't think that's an Orium thing. I think that's like anybody who's applying this agentic software engineering thing is noticing that the middle is starting to become pretty fast. It'll keep getting better and better. It's the beginning and the end, the the defining and the verifying that are the parts that you know that are actually starting to become more of the bottleneck. Whereas, you know, it used to be I've got a whole list of things in those slow developers and now it's the developers is saying, can you give me more stuff and also could you like do your job and define it better before you hand it to me?

00:45:48

Ryan Lunka: you know,

Jessica Dvoretz: Andrew, go

Ryan Lunka: as we're talking just as we're talking this out loud,

Jessica Dvoretz: ahead.

Ryan Lunka: I'm in my head convincing myself that we don't want to get into developer metrics conversations because it's actually the wrong way to solve it. And then if you reground it back in a capex and CFO conversation, which might work its way down to developer productivity at some point, like that's that's actually the discipline that the organization should have. It shouldn't be how fast are my developers writing code or how much more code are they writing or what the qu I mean what the quality is. It should all come downstream of a financial capital allocation conversation. And I don't think most companies even remotely do that.

Everett Zufelt: I agree. I agree. I I would also agree. It's probably it's like a big hairy ball of whatever right now and probably not. We can probably create a lot of value through this working group and not touch on that yet. Um maybe we'll even at some point spin up another working group that just tries to have that conversation.

00:46:43

Everett Zufelt: I don't know. Um but I don't I think we might get to it like you said through one of the other channels or touch on it. But we probably don't need to start with an article that says how to how you know how to solve the problem of agent driven software development.

Ryan Lunka: You're going to find a wide variety of um how companies are able to or ready to from I have no idea we don't do anything all the way to like a sophisticated doormetrics implementation of how to measure developer productivity. It's going to be all over across the board. Every single company's going to have a P&L and every single company is going to have the same things on their P&L because GAP forces everybody onto a standard that is useful grounding to make sure that we can have a conversation that applies everywhere.

Everett Zufelt: Well, it sounds like we've got a couple interesting areas,

Ryan Lunka: Perfect.

Everett Zufelt: right? There's the more governance audit direction. There's the more strategy plan, northstar, you know, move from experiment to consequential value direction.

00:47:44

Everett Zufelt: Are there, you know, notwithstanding, there might be some of us who like to work on more than one um at the same time, are there folks who feel like more strongly oriented toward one or the other side of that conversation?

Jessica Dvoretz: I am probably more helpful on the strategy one. Um, but happy to participate however I can.

Everett Zufelt: Andrew, do you have a particular one that you lean more heavily toward?

Andrew Kumar: No, no. I would have to reflect on it. Um,

Everett Zufelt: Okay.

Andrew Kumar: if we could post everything to Slack him

Everett Zufelt: Yeah. Yeah. Yeah. So, maybe that's the right next step. Like I can work with uh Rebecca to like sum this up into like a couple of items. Maybe three fall out, I don't know, but two or three items. And then I think we just can maybe between now and our next meeting a couple weeks from now, we just if if those who kind of self-organize around those bullet points, like if you could even just come back with like three to five sub bullets, right?

00:48:53

Everett Zufelt: like Rebecca and I can post like one there, group A, group B, possibly group C, and then kind of self-organize and come back with what are the three or four sub bullets and then we'll just

Ryan Lunka: There's little

Everett Zufelt: kind of use that to keep moving the work forward.

Ryan Lunka: people.

Everett Zufelt: But I think these are really valuable topic areas and and you know the conver certainly the conversations I'm having with

Jennifer Wright: Yeah.

Everett Zufelt: companies, these are questions that are coming up over and over and over again.

Jessica Dvoretz: And is the um I think Andrew put this in the chat, but is the objective to have something ready for Amsterdam like the infra group or are we talking about publications? So we have our own deadline and Amsterdam is less kind of

Everett Zufelt: I think I think Amsterdam's less pressing for this one. I think for the hackathon one,

Jessica Dvoretz: the

Everett Zufelt: it's like human hackathon, humans in a place kind of put a stick a date and a time on it. I think we can publish things on a rolling schedule, right?

00:49:46

Everett Zufelt: Like maybe we have and I haven't talked to Holly about this so maybe Rebecca you could help us like I suspect there's probably going to be a slot in the Amsterdam agenda for the working groups to share out like

Ryan Lunka: Starts.

Everett Zufelt: for a little 10 minutes or 15 minutes or whatever you know what they've been working on and what they're going to be working on next. I imagine we'll want to do that. Um but I would think we can probably get some of these things published in advance and maybe launch something fancy at mockex and just keep on rolling past the end of mock. So, I think we can have a bit more of a rolling

Rebecca Veldon: Yep.

Everett Zufelt: timeline.

Rebecca Veldon: I have a conversation tomorrow afternoon regarding MacX and agenda.

Jessica Dvoretz: Great.

Rebecca Veldon: So, I'll try and force my way in with this.

Everett Zufelt: Excellent. I always find that the person who speaks with the most confidence wins. So, that's that's

Rebecca Veldon: Yeah,

Everett Zufelt: whatever.

Rebecca Veldon: 100%.

Jennifer Wright: just uh because we have people on the call because I know Dylan was wondering about moving this meeting earlier.

00:50:42

Jennifer Wright: the I think he proposed two times either 10:00 a.m. Eastern or 9:30. Does anyone have any immediate reactions to either of those so we can maybe finalize it quickly? Yeah, you're good either

Rebecca Veldon: Nope.

Jessica Dvoretz: 10:00 a.m.'s better for me than

Jennifer Wright: way.

Everett Zufelt: I'm happy to do either.

Rebecca Veldon: What?

Jessica Dvoretz: 9:30.

Everett Zufelt: I don't think we have anybody west.

Rebecca Veldon: I'm trying to

Everett Zufelt: I don't think we have anybody Pacific time in the working group. I think uh we'd originally picked the 10:00 a.m.

Rebecca Veldon: No.

Everett Zufelt: time because that's like 7 or sorry the 11 a.m. time because it's 7 a.m. or 8 a.m. West Coast, but I don't think we have West Coast joiners. So unless we pick some up, I'm good with either.

Ryan Lunka: We're too pragmatic for Silicon Valley AI people.

Everett Zufelt: Exactly.

Rebecca Veldon: Okay,

Jennifer Wright: Uh,

Rebecca Veldon: I'm move this now.

Jennifer Wright: Andrew. Yeah, 10 a.m. works for you,

Rebecca Veldon: Sorry.

Jennifer Wright: Andrew. And Rebecca, you said that's okay with you.

Rebecca Veldon: Yep. So, just moving an arrow earlier.

Jennifer Wright: Wonderful. Thank you.

Everett Zufelt: Lovely. All right. Well,

Jessica Dvoretz: Thanks.

Everett Zufelt: thanks everyone. I really I really appreciate

Rebecca Veldon: What's

Jennifer Wright: And Ryan,

Everett Zufelt: it.

Jessica Dvoretz: Great to meet you.

Jennifer Wright: congrats on getting that article at one one part one of

Ryan Lunka: Yeah,

Jennifer Wright: three.

Ryan Lunka: turn out good. Thanks for everybody hopping. I like it.

Jennifer Wright: All right. Thanks, folks.

Jessica Dvoretz: Thanks everyone.

Ryan Lunka: Bye, guys.

Rebecca Veldon: Bye?
